

Our Credit Risk Services

RedShift International offers credit risk consultancy in the areas of road mapping, system selection, business case production, requirements gathering, workflow configuration as well as rollout, implementation and system support. In addition we offer services to check the accuracy and alignment of legal executed contracts with the electronic versions.

RedShift can offer advice on project budgets, realistic timescales, project organisation and project structure. Our aim is to show real benefits from any engagement as quickly as possible for our clients and recommend strategic routes.

Assessment and Planning

RedShift provides pragmatic and realistic advice and support to assess an operation's risk technology needs and plan a system roll out and implementation. We can assess the suitability of 3rd party or in-house solutions based on the strategic requirements of the stakeholders and subsequently plan and manage the project.

We offer the following services to assess and plan a credit system installation:

Roadmapping

RedShift can identify your options for moving forward your credit infrastructure and system facilities, whether at the beginning of a project or simply to optimise an existing setup.

We offer strategic advice on the pros and cons of different routes or solutions .

Business Case Production

Using our structured methodology, we can evaluate the return that would be realised from proceeding or not proceeding down a particular project route. We perform a structured evaluation of the benefits to be attained by following a particular option. This combined with estimates of the project cost permit us to offer a return on investment figure, within a certain level of confidence.

Requirements Gathering

Before a project phase can begin it is necessary to have the requirements gathered in a structured manner. They then form the nucleus of each subsequent phase. We use a structured method to gather requirements for a credit project, to the exact level of detail required by the client in question. We can also bring pre defined lists of requirements produced by our personnel using their experience of multiple previous projects.

System Selection

Using our system selection methodology to run an objective, deterministic process to decide which system to install, whether from a software supplier or using another route.

RedShift offers a unique insight into the suitability of any proposed vendor or in-house system, based on our vast knowledge of system and client requirements, highlighting strengths and weaknesses of any proposal.

Process and Design

Workflow Design

Credit risk processes involve detailed workflows where the final outcome can often involve many different stages as well as many individuals who interact at these different stages of the process. RedShift has experience and expertise not only in defining workflow processes, but also in creating and configuring them using system tools once the processes are designed.

Workflow Efficiency

In any organisation there can be unknown bottle necks that reduce the ultimate efficiency of processes. RedShift can help define and then measure the efficiency of any given workflow and help to improve and measure its performance, prior to its configuration in a system.

Roll out, Configuration and Support

A large part of a successful system implementation is the optimisation and understanding of user requirements and translating this into an effective system configuration. RedShift is uniquely placed to perform this task due to our unrivalled experience in this field.

We offer several specific services and skills around system roll out that can be applied to a new roll out, an upgrade or to unlocking more value out of an existing installation:

Project Management

RedShift offers successful and experienced project managers that can oversee and proactively lead the

Business Analysis

RedShift can provide first class business analysts that can help define an organisation's business requirements and offer advice on which elements provide immediate value and which are expensive to ultimately achieve

Report Definition and Writing

Most credit projects will require new and bespoke reports or the alteration of existing standard reports. RedShift provides consultants who are familiar with the data structures of the leading credit systems and have detailed knowledge of the reporting tools these systems offer.

Workflow Configuration

RedShift has experience and expertise in not only defining workflow processes, but also creating and configuring them using system tools.

User Acceptance Testing

Through our detailed knowledge of credit system testing we can perform these tests for you by using our RedShift UAT Testing Methodology.

System Training

RedShift provides both operational and user training for credit systems.

Documentation and Help Files

RedShift offer several types of documentation, each tailored exactly to the needs of the installation in question.

Legal Agreement Accuracy Checking

RedShift offers a methodology for comparing a series of legally executed contracts with the electronic versions that are present in one or many systems. Errors in data entry can cause the exposures in the system to be calculated wrongly, whether too high or too low. Such discrepancies can be extremely costly especially when computing potentially inaccurate netting offsets or margin calls.
